Why look at change over time?

A research paper, a measurement, and a personal observation can each prompt a question. What do they mean in context? What happened before or after? What remains uncertain?

We want to explore whether looking at research and experience over time can help people formulate clearer questions. Collecting more information is not the goal in itself.

For us, **longitudinal** means paying attention to change over time rather than treating each observation as an isolated snapshot. It does not mean assuming that one event caused another.

Evidence. Experience. Exploration.

Three connected ideas guide the project. Keeping their differences visible matters as much as exploring them together.

Evidence

What does published research report, and how strong is its support?

We intend to make research claims traceable to their sources and explain relevant limitations. A citation is a starting point for checking a claim, not a reason to stop asking questions.

Experience

What does a person notice over time?

Lived experience helps shape the questions worth asking. We will not treat one person's observation as proof of a treatment effect or a cause.

That does not dismiss lived experience. When personal reports are used in research, we will ask how they were collected and what the study can reasonably conclude.

Exploration

What could emerging technology help us investigate?

AI, sensing, and other tools are possibilities to examine, not answers in themselves. We intend to judge experiments by what they can demonstrate and to state what remains unknown.

An experimental tool is not established medical treatment. People remain responsible for interpretation and decisions.

Parkinson's: our first initiative

Parkinson's is where this work begins. It is personally meaningful to the founder and gives the initiative a focused place to start asking questions about research, experience, and change over time.

One question we want to refine is:

What would help people make sense of research and day-to-day observations well enough to ask a clearer question?

The first step is to understand the question, not to build a system that interprets someone's condition.

Parkinson's is the first initiative, not the limit of the organization's interests. Any future expansion would need its own purpose and justification.

This website is not enrolling a study or collecting health records.

How the question began

The founder's interest in emerging technology took shape early in his software career at Rebar Foundry, a dot-com-era incubator exploring new technologies. It encouraged a lasting habit: turn an intriguing possibility into something practical, then examine what it can actually do.

After decades building software, a Parkinson's diagnosis brought a different set of questions into that work. Cycling and a long-distance ride to raise Parkinson's awareness became part of the connection between technology and everyday experience.

Technology experiments around the ride collected information about the journey. They were an opportunity to investigate measurement, not evidence of a treatment effect.

That work prompted a broader question: what might become possible if published research, experience over time, and emerging technology were considered together, without confusing their different roles?

The Emergent Collaborative begins with that question. The aim is not to make one person's story stand for everyone else's, but to invite other perspectives into a careful exploration.

> [PUBLIC ORIGIN WORDING/PERMISSIONS — APPROVAL PENDING]

What exists today

The work is at the definition and content-prototype stage. The founding product brief and website requirements have been approved as the basis for this website.

Website content and structure

Status: Prototype — internal written draft

This draft explores how to explain the initiative, distinguish its ideas, and invite useful collaboration. It is a content prototype, not a working website, research tool, or medical service. Audience review will help refine it.

Documentation status checked: **18 October 2026**.

Possible later directions

Status: Idea

Future work could explore organizing research sources, source-linked research assistance, or ways of examining change over time. These are proposals, not services offered by this website or commitments to delivery dates.

Any future work involving personal records, sensing, or analysis would need separate requirements, privacy safeguards, and evaluation. Public research information and private personal information would remain separate.

This first website will not offer accounts, health logging, device connections, AI chat, or personalized medical interpretation.

Help shape the next step

> **Review annotation / PH-17**
>
> [FUTURE SOFTWARE IMPLEMENTATION STATUS — UNVERIFIED; IDEAS ARE NOT AVAILABLE SERVICES]

Help shape the next questions

You do not need to be a researcher or developer to offer a useful perspective. Ways to contribute could include:

- Pointing out unclear language or a question the project has overlooked.
- Challenging an assumption or suggesting a more careful research approach.
- Helping make information easier to read and navigate.
- Discussing a small, well-defined technical investigation.

These are starting points for a conversation, not staffed openings or promises of a project role.

Before you email

> Please keep your message about the project. **Do not send medical records, symptom histories, medication details, location traces, or other sensitive health information. Do not attach files.**
>
> This channel does not provide medical advice and is not monitored for urgent help. Contacting us does not enroll you in research or authorize publication of your message.

Email shares your address and message with the email services involved. Read Privacy and contact information before deciding what to send.

Email about the project

Unresolved / PH-01

[DEDICATED EMAIL ADDRESS — UNASSIGNED; MOCKUP CONTACT IS INACTIVE]

REVIEW ANNOTATION — NOT WEBSITE COPY

Nonfunctional email-action placement: Email about collaboration. No address or delivery.

You can use your own email service. If an email application does not open, copy the address into a new message.

A short note about the question or contribution you have in mind is enough. You do not need to disclose a diagnosis or personal health history. Your name, organization, and professional background are optional.

You can use the same address to flag a correction or ask about information handling.

Unresolved / PH-02

[CONTACT ROLE AND RESPONSE EXPECTATION — FOUNDER APPROVAL PENDING]

Sources and context

When we make a research claim, we intend to show where it comes from and explain the limits that matter to its interpretation.

Personal accounts and project proposals are identified as such. They are not presented as scientific findings.

REVIEW ANNOTATION — NOT WEBSITE COPY

No scientific source entries in this concept.

Responsibility and corrections

The Emergent Collaborative is an early-stage, founder-led initiative. This website explains its direction and invites project collaboration; it is not a clinical service.
